

Nasogastric tube position confirmation record

Nasogastric tube position confirmation record

The position of the nasogastric tube should be checked:

- Following initial insertion (please use placement checklist to record this).
- Before administering each feed.
- Before giving medications.
- Any new or unexplained respiratory symptoms, if oxygen saturations decrease or any other clinical concerns.
- At least 12 hourly during continuous feed and each time tube is accessed e.g. medication administration.
- Following episodes of vomiting, retching or coughing spasms.
- When there is suggestion of tube displacement.

[illegible]

If any new or unexplained respiratory symptoms, stop feed immediately and contact medical team.
